Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cc plasminogen. K5 peptide fragments homologous to this sequence, are carticularly primary or metastatic solid tumours, carcinomas, sarcomas, periodic fragments homologous to this sequence, are lymphomas, haemangiomas. They can also be used for treating or preventing cancer, cc lymphomas, haemangiomas. They can also be used for treating or preventing psoriasis, arthritis, macular degeneration and diabetic retinopathy. The crapillary proliferation within atherosclerotic plaque, haemophiliac compiliary proliferation, ulcres etc., also as contraceptives that compiliary proliferation, ulcres etc., also as contraceptives that compiliary proliferation, ulcres etc., also as contraceptives that compiliary opinists can be used similarly, optionally coupled to cytotoxic agents. Antagonists may be used to induce angiogenesis, e.g. for wound capents. Antagonists may be used to induce angiogenesis, e.g. for wound capents. Antagonists and for affinity purification of K5 receptors. The K5 receptors may then be expressed in tumour cells to increase their cresponse to the peptides or used for identification of smaller compiliary they have solotimes greater inhibitory against bovine capillary cells in vitro than kringle 1-4 peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

The kringle 5 peptides are inhibitors of angiogenesis and endothelial cell proliferation and migration. The peptides are useful for treating angiogenic diseases, primary and metastatic solid tumours and carcinomas of various organs such as breast, genital tract, endocrine glands, skin, tumours of the brain and eyes and solid tumours arising from haematopoietic malignancies such as leukaemias and lymphomas. They are also used for the prophylaxis of various autoimmune diseases (e.g., rheumatoid arthritis), coular diseases, skin diseases, skin diseases, rheumatoid arthritis), coular diseases, skin diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAB36572
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a CC reactive group (II) (e.g. succinimidyl and maleimido groups) attached to C reactive group (II) active amino acid region (IV), which covalently CC bonds with amino/hydroxyl/thiol groups on blood components to form a CC peptidase stabilised therapeutic peptide composed of 3-50 amino acids. CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth CC factors and neurotransmitters, to protect them from peptidase activity CC in vivo for the treatment of various disorders. Endogenous therapeutic CC peptides are not suitable as drug candidates as they require frequent CC administration due to rapid degradation by peptidases in the body. CC Modifying and attaching therapeutic peptides to albumin prevents or CC life) and specificity as bonding to large molecules decreases. CC intracellular uptake and interference with physiological processes. CC AAB90829 to AAB92441 represent peptides which can be used in the CC exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Crapillary proliferation within atherosclerotic plaque, haemophiliac copillary proliferation within atherosclerotic plaque, haemophiliac copillary, wound granulation, ulcers etc., also as contraceptives that complete to valetion and establishment of the placenta. K5 antisera or complete to cytotoxic complete copillary coupled to cytotoxic completes. Antagonists may be used to induce angiogenesis, e.g. for wound complete completes are also used to raise specific antibodies (Ab), complete copillary the peptides are also used to raise specific antibodies (Ab), complete copillary the peptides or used for identification of smaller completes to the peptides or used for identification of smaller completes. The Ab are used to detect/quantify the peptides in complete completes and copillary copillary colls with low toxicity against complete copillary cells in vitro than kringle 1-4 peptides.

                                                                                                                                                                                                                                                       14-MAY-1998
                                                                                                                                                                                                                                                                                                                                 AAW34304 standard; peptide; 7 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence is synthetic a kringle 5 (K5) peptide homologous to human plasminogen. K5 peptide fragments homologous to this sequence, are anti-angiogenesis agents, specifically for treating or preventing cancer, particularly primary or metastatic solid tumours, carcinomas, sarcomas, lymphomas, haemangiomas. They can also be used for treating or preventing psoriasis, arthritis, macular degeneration and diabetic retinopathy. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New kringle 5 peptide(s) and fusion proteins derived from plasminogen - useful as anti-angiogenesis agents for treating cancer, psoriasis, arthritis etc., including gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     03-APR-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                CC This sequence is synthetic a kringle 5 (K5) peptide homologous to human CC plasminogen. K5 peptide fragments homologous to this sequence, are CC anti-angiogenesis agents, specifically for treating or preventing cancer, CC lymphomas, primary or metastatic solid tumours, carcinomas, sarcomas, CC lymphomas, haemangiomas. They can also be used for treating or preventing psoriasis, arthritis, macular degeneration and diabetic retinopathy. The CC rapillary proliferation within atherosclerotic plaque, haemophiliac CC capillary proliferation within atherosclerotic plaque, haemophiliac CC capillary proliferation, ulcers etc., also as contraceptives that CC inhibit ovulation and establishment of the placenta. K5 antisera or CC capillary proliferation be used similarly, optionally coupled to cytotoxic cagents. Antagonists may be used to induce angiogenesis, e.g. for wound thealing. The K5 peptides are also used to raise specific antibodies (Ab), CC receptors may then be expressed in tumour cells to increase their CC response to the peptides or used for identification of smaller CC antagonists. The Ab are used to detect/quantify the peptides in CC biological samples. The K5 peptides (and K5 fusion proteins) selectively inhibit proliferation of endothelial cells with low toxicity against CC against bovine capillary cells in vitro than kringle 1-4 peptides.

K5 antisera or (ant)agonists can be used similarly, optionally coupled to cytotoxic agents. Antagonists may be used to induce angiogenesis, e.g. for wound healing. The K5 peptides are also used to raise specific antibodies (Ab), for diagnosis and for affinity purification of K5 receptors. The K5 receptors may then be expressed in tumour cells to increase their response to the peptides or used for identification of smaller antagonists. The Ab are used to detect/quantify the peptides in biological samples. The K5 peptides (and K5 fusion proteins) selectively inhibit proliferation of endothelial cells with low toxicity against normal cells. Typically they have 800-times greater inhibitory activity against bovine capillary cells in vitro than kringle 1-4 peptides.
                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                    joints, vound granulation, ulcers etc., also as contraceptives that inhibit ovulation and establishment of the placenta. K5 antisera or (ant)agonists can be used similarly, optionally coupled to cytotoxic agents. Antagonists may be used to induce angiogenesis, e.g. for wound healing. The K5 peptides are also used to raise specific antibodies (Ab), for diagnosis and for affinity purification of K5 receptors. The K5 receptors may then be expressed in tumour cells to increase their response to the peptides or used for identification of smaller antagonists. The Ab are used to detect/quantify the peptides in biological samples. The K5 peptides (and K5 fusion proteins) selectively inhibit proliferation of endothelial cells with low toxicity against normal cells. Typically they have 800-times greater inhibitory activity against bovine capillary cells in vitro than kringle 1-4 peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        metastatic solid tumour; carcinoma; sarcoma; lymphoma; haemangioma; psoriasis; arthritis; macular degeneration; diabetic retinopathy; autoimmune disease; ocular disease; capillary proliferation; therap
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     psoriasis, arthritis, macular degeneration and diabetic retinopathy. fragments can also be used to treat autoimmune or ocular diseases, capillary proliferation within atheroscleroic plaque, haemophiliac
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             plasminogen. K5 peptide fragments homologous to this sequence, are anti-angiogenesis agents, specifically for treating or preventing cancer, particularly primary or metastatic solid tumours, carcinomas, sarcomas, lymphomas, haemangiomas. They can also be used for treating or preventing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence is synthetic a kringle 5 (K5) peptide homologous to human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New kringle 5 peptide(s) and fusion proteins derived from plasminogen - useful as anti-angiogenesis agents for treating cancer, psoriasis, arthritis etc., including gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Davidson DJ,

                                                                   Query Match
                                                                                                                                                                        (ant)agonists can be used similarly, optionally coupled to cytotoxic agents. Antagonists may be used to induce angiogenesis, e.g. for wound healing. The K5 peptides are also used to raise specific antibodies (Ab), for diagnosis and for affinity purification of K5 receptors. The K5 receptors may then be expressed in tumour cells to increase their response to the peptides or used for identification of smaller antagonists. The Ab are used to detect/quantily the peptides in biological samples. The K5 peptides (and K5 fusion proteins) selectively inhibit proliferation of endothelial cells with low toxicity against normal cells. Typically they have 800-times greater inhibitory activity against bovine capillary cells in vitro than kringle 1-4 peptides.
                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           capillary proliferation within atherosclerotic plaque, haemophiliac joints, wound granulation, ulcers etc., also as contraceptives that inhibit ovulation and establishment of the placenta.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAW34291
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 10
                                                                                                                                                                                                            particularly primary or metastatic solid tumours, carcinomas, sarcomas, lymphomas, haemangiomas. They can also be used for treating or preventing psoriasis, arthritis, macular degeneration and diabetic retinopathy. The fragments can also be used to treat autoimmune or ocular diseases, capillary proliferation within atherosclerotic plaque, haemophiliac
           response to the peptides or used for identification of smaller antagonists. The Ab are used to detect/quantify the peptides in biological samples. The K5 peptides (and K5 fusion proteins) selectively inhibit proliferation of endothelial cells with low toxicity against
                                                                                joints, wound granulation, ulcers etc., also as contraceptives that inhibit ovulation and establishment of the placenta. K5 antisera or (ant)agonists can be used similarly, optionally coupled to cytotoxic agents. Antagonists may be used to induce angiogenesis, e.g. for wour healing. The K5 peptides are also used to raise specific antibodies for diagnosis and for affinity purification of K5 receptors. The K5 receptors may then be expressed in tumour cells to increase their
                                                                                                                                                                                                                                                                                                  This sequence is a kringle 5 (K5) peptide homologous to human plasminogen. K5 peptide fragments homologous to this sequence, are anti-angiogenesis agents, specifically for treating or preventing cancer,
                                                                                                                                                                                                                                                                                                                                                                           Claim 62; Page 67; 78pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                           cancer, psoriasis, arthritis etc., including gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                              New kringle 5 peptide(s) and fusion proteins derived from plasminogen - useful as anti-angiogenesis agents for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Davidson DJ,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           So
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                            endothelial cell proliferation and migration. The peptides are useful for treating angiogenic diseases, primary and metastatic solid tumour and carcinomas of various organs such as breast, genital tract,
                                                                                                   The invention relates to a method of preparing plasminogen kringle 5 peptide fragments. The method comprises mixing mammalian plasminogen and elastase in the ratio 1:100-1:300, followed by incubating and isolating the fragment. The kringle 5 peptides are inhibitors of angiogenesis and
                                                                                                                                                                                                Preparation of Kringle five peptide fragment for treating various disorders such as anglogenic, ocular, skin diseases and cancer, involves mixing mammalian plasminogen and elastase followed by incubation and isolation -

The invention relates to a method of preparing plasminogen kringle 5 peptide fragments. The method comprises mixing mammalian plasminogen and plasmase in the ratio 1:100-1:300, rises mixing mammalian plasminogen and telastase in the ratio 1:100-1:300 are inhibitors of angiogenesis and the fragment. The kringle 5 peptides are inhibitors of angiogenesis and endothelial cell proliferation and migration. The peptides are useful for treating angiogenic diseases, primary and metastatic solid tumours

and

various organs such as breast,

genital tract,

Example 11; Column 38; 48pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Syndrome), diseases caused by excessive or abnormal stimulation of endothelial cells (e.g., Crohn's disease, atherosclerosis), diseases which have angiogenesis as a pathologic consequence (e.g., cat scratch disease and ulcers). The peptides are also useful as a birth control agent which inhibits ovulation and establishment of the placenta. Sequences AABO1888, AABO1889 and AABO1895-B01905 represent human plasminogen kringle 5-derived peptides synthesised and used in exemplifications of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    endocrine glands, skin, tumours of the brain and eyes and solid tumours arising from haematopoietic malignancies such as leukaemias and lymphomas. They are also used for the prophylaxis of various autoimmune diseases (e.g., rheumatoid arthritis), ocular diseases, skin diseases

The invention relates to a method of preparing peptide fragments. The method comprises mixing elastase in the ratio 1:100-1:300, followed by

plasminogen kringle 5 mammalian plasminogen and incubating and isolating

The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidy) and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently

amino/hydroxyl/thiol groups on blood

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ΩV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            the fragment. The kringle 5 peptides are inhibitors of angiogenesis and cendothelial cell proliferation and migration. The peptides are useful for treating angiogenic diseases, primary and metastatic solid tumours and carcinomas of various organs such as breast, genital tract, carcinomas of various organs such as breast genital tract, carcinomas from haematopoletic malignancies such as leukaemias and carising from haematopoletic malignancies such as leukaemias and cymphomas. They are also used for the prophylaxis of various autoimmune chiefer (e.g., rheumatoid arthritis), ocular diseases, skin diseases (e.g., psoriasis), blood vessel diseases (e.g. haemangiomas, Osler-Webber (c.g., psoriasis), blood vessel diseases (e.g. haemangiomas, Osler-Webber (c.g., psoriasis), diseases caused by excessive or abnormal stimulation of cendothelial cells (e.g., Crohn's disease, atherosclerosis), diseases (which have angiogenesis as a pathologic consequence (e.g., cat scratch (c.g., cat ovulation and establishment of the placenta. CC sequences AAB01888, AAB01889 and AAB01895-B01905 represent human plasminogen kringle 5-derived peptides synthesised and used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The present invention describes a modified anti-angiogenic peptide (I) comprising a reactive group that reacts with amino groups, hydroxyl groups or thiol groups on blood components to form stable covalent bonds. The reactive group is selected from succinimidyl or maleimido groups. (I) can have anti-inflammatory, vasotropic, cytostatic, antirheumatic, antipsoriatic, antidiabetic, antiarteriosclerotic and osteopathic activities, and is an angiogenesis inhibitor. (I) are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Kringle 5; anti-angiogenic; modified; blood protein; anti-inflammatory; resortopic; cytostatic; antirheumatic; antipsoriatic; antidiabetic; antiarteriosclerotic; osteopathic; antiogenesis inhibitor; angiogenesis; inflammatory disorder; inflammation; chronic articular rheumatism; psoriasis; diabetic retinopathy; neovascular glaucoma; restenosis; capillary proliferation; atherosclerotic plaque; osteoporosis; cancer; solid tumour; angiofibroma; retrolental fibroplasia; haemangioma; Kasposi's sarcoma; neovascularisation; tumour growth.
                                                                                                                                                                                                                                                                                                                                        New modified anti-angiogenic kringle 5 peptides capable of forming conjugates with blood proteins, useful for treating angiogenesis, inappropriate invasion of vessels or cancers in humans or mammals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes. AAB90829 to AAB92441 represent peptides which can be used in the exemplification of the present invention.

                                                                                                                           Q
                                                                                                                                                                                                                                                          CC with blood proteins. (I) are also useful for manufacturing a medicament CC extending the in vivo half-life of a kringle 5 peptide in a patient to CC provide an anti-angiogenic effect. In particular, a modified kringle 5 CC peptide can be used for treating inflammatory disorders (e.g. immune and Cn non-immune inflammation, chronic articular rheumatism or psoriasis), CC disorders associated with inappropriate or inopportune invasion of CC vessels (e.g. diabetic retinopathy, neovascular glaucoma, restenosis, CC capillary proliferation in atherosclerotic plaques or osteoporosis), or CC cancer associated disorders (e.g. solid tumours, solid tumour CC metastases, angiofibronmas, retrolental fibroplasia, haemangiomas, CC Kasposi's sarcoma or other cancers requiring neovascularisation to CC support tumour growth). The peptides are useful for treating these CC diseases in mammalian or human patients. AAB36502 represents a mammalian CC kringle 5 protein, and AAB3653 to AAB36577 represent specifically vy
                                                                                                                                                                          Matches

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

K5 antisera or collar diseases, and establishment of the placenta. K5 antisera or collar diseases, and sease sease and collar diseases, e.g. for wound collar diseases, and for affinity purification of K5 receptors. The K5 peptides are also used to raise specific antibodies (Ab), for diagnosis and for affinity purification of K5 receptors. The K5 corresponse to the peptides or used for identification of smaller antiagonists. The Ab are used to detect/quantify the peptides in biological samples. The K5 peptides (and K5 fusion proteins) selectively commal cells. Typically they have 800-times greater inhibitory activity against bovine capillary cells in vitro than kringle 1-4 peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

K5 peptide fragments homologous to this sequence, are anti-angiogenesis agents, specifically for treating or preventing cancer,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC the fragment. The kringle 5 peptides are inhibitors of angiogenesis and conditional cell proliferation and migration. The peptides are useful cc endothelial cell proliferation and migration. The peptides are useful cc for treating angiogenic diseases, primary and metastatic solid tumours can carcinomas of various organs such as breast, genital tract, can carcinomas of various organs such as breast, genital tract, conditional from haematopoletic malignancies such as leukaemias and clymphomas. They are also used for the prophylaxis of various autoimmune cc diseases (e.g., rheumatoid arthritis), ocular diseases, skin diseases cc (e.g., psoriasis), blood vessel diseases (e.g. haemangiomas, Osler-Webber cc Syndrome), diseases caused by excessive or abnormal stimulation of conditional cells (e.g., Crohn's disease, atherosclerosis), diseases cubich have angiogenesis as a pathologic consequence (e.g., cat scratch cc agent which inhibits ovulation and establishment of the placenta. Cc sequences AAB01889, AAB01889 and AAB01895-B01905 represent human cc plasminogen kringle 5-derived peptides synthesised and used in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Qγ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a CC comprising a therapeutically active amino acid region (III) and a creative group (II) (e.g. succinimidyl and maleimido groups) attached to C reactive group (II) active amino acid region (IV), which covalently CC bonds with amino/hydroxyl/thiol groups on blood components to form a CC peptidase stabilised therapeutic peptide composed of 3-50 amino acids. CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth CC factors and neurotransmitters, to protect them from peptidase activity CC in vivo for the treatment of various disorders. Endogenous therapeutic CC peptides are not suitable as drug candidates as they require frequent CC administration due to rapid degradation by peptidases in the body. CC reduces the action of peptidases to increase length of activity (half CC intracellular mentals and interference with physical activity (half contention) and specificity as bonding to large molecules decreases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a modified anti-angiogenic peptide comprising a reactive group that reacts with amino groups, hydroxyl groups or thiol groups on blood components to form stable covalent bonds. The reactive group is selected from succinimidyl or maleimid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New modified anti-angiogenic kringle 5 peptides capable of forming conjugates with blood proteins, useful for treating angiogenesis, inappropriate invasion of vessels or cancers in humans or mammals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 6; Page 9; 82pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        contracting togenes is agency, specifically not interching the money, cancer, architecturing primary or metastatic solid tumours, carreinomas, sarcomas, companies, and also be used for treating or preventing psoriasis, arthritis, macular degeneration and diabetic retinopathy. The Crapillary proliferation within atherosclerotic plaque, haemophiliac compillary proliferation within atherosclerotic plaque, haemophiliac compillary proliferation within atherosclerotic plaque, haemophiliac compillary proliferation, ulcers etc., also as contraceptives that companies in an an establishment of the placenta. So antisera or compile compositions and establishment of the placenta. So antisera or compile composition of an establishment of the placenta. So antisera or composition and establishment of the placenta. So antisera or companies. Antagonists may be used to induce angiogenesis, e.g. for wound compile the solution of the proliferation and for affinity purification of K5 receptors. The K5 composition of the periodes (ab), composition of the periodes (ab) are used to detect/quantify the periodes in composition of smaller compositions. The Ab are used to detect/quantify the periodes in composition of smaller compositions and the substitution of smaller compositions. The K5 peptides (and K5 fusion proteins) selectively compositions and compositions and compositions and composition of smaller compositions and compositions and compositions and compositions are used to detect/quantify the peptides in commosition of smaller compositions and compositions and compositions and compositions are used to detect the composition of smaller compositions are used to detect the composition of smaller compositions and compositions are used to detect the composition of smaller compositions and compositions are used to detect the composition of smaller compositions are used to detect the composition of smaller compositions and compositions are used to detect the composition of smaller compositions are used to detect the composition of small

                                                                                                                                                                                                                                                                                                          CC plasminogen. K5 peptide fragments homologous to this sequence, are anti-angiogenesis agents, specifically for treating or preventing cancer, cc particularly primary or metastatic solid tumours, carcinomas, sarcomas, cc lymphomas, haemangtomas. They can also be used for treating or preventing cp psoriasis, arthritis, macular degeneration and diabetic retinopathy. The cc psoriasis, arthritis, macular degeneration and diabetic retinopathy. The cc partial proliferation within atherosclerotic plaque, haemophiliac compiliary proliferation within atherosclerotic plaque, haemophiliac compiliary proliferation, ulcers etc., also as contraceptives that compiliar of plates, wound granulation, ulcers etc., also as contraceptives that compiliar of compiliar of compiliar of the placenta. K5 antisera or cc (ant)agonists can be used similarly, optionally coupled to cytotoxic agents. Antagonists may be used to induce angiogenesis, e.g. for wound cc agents. Antagonists may be used to induce angiogenesis, e.g. for wound cc agents and for affinity purification of K5 receptors. The K5 cr deeptors may then be expressed in tumour cells to increase their cc response to the peptides or used for identification of smaller cc antagonists. The Ab are used to detect/quantify the peptides in commal cells. Typically they have 800-times greater inhibitory activity against bovine capillary cells in vitro than kringle 1-4 peptides.
                                                                                                                                          B
                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                autoimmune disease; ocular disease; capillary proliferation; therapy; kringle 5 receptor.

                                                                                                                                                                                 C capillary proliferation within atherosclerotic plaque, haemophiliac joints, wound granulation, ulcers etc., also as contraceptives that inhibit ovulation and establishment of the placenta. K5 antisera or (ant)agonists can be used similarly, optionally coupled to cytotoxic agents. Antagonists may be used to induce anglogenesis, e.g. for wound healing. The K5 peptides are also used to raise specific antibodies (Ab), for diagnosis and for affinity purification of K5 receptors. The K5 receptors may then be expressed in tumour cells to increase their response to the peptides or used for identification of smaller antagonists. The Ab are used to detect/quantify the peptides in commandical samples. The K5 peptides (and K5 fusion proteins) selectively inhibit proliferation of endothellal cells with low toxicity against cormal cells. Typically they have 800-times greater inhibitory activity against bovine capillary cells in vitro than kringle 1-4 peptides.
                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence is a kringle 5 (K5) peptide homologous to human plasminogen. K5 peptide fragments homologous to this sequence, are anti-angiogenesis agents, specifically for treating or preventing cancer, particularly primary or metastatic solid tumours, carcinomas, sarcomas, lymphomas, haemangiomas. They can also be used for treating or preventing psoriasis, arthritis, macular degeneration and diabetic retinopathy. The fragments can also be used to treat autoimmune or ocular diseases,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 62; Page 67; 78pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAW34291
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 10
                                                                                 anti-anglogenesis agents, specifically for treating or preventing cancer, particularly primary or metastatic solid tumours, carcinomas, sarcomas, lymphomas, haemangiomas. They can also be used for treating or preventing psoriasis, arthritis, macular degeneration and diabetic retinopathy. The fragments can also be used to treat autoimmune or ocular diseases, capillary proliferation within atherosclerotic plaque, haemophiliac joints, wound granulation, ulcers etc., also as contraceptives that inhibit ovulation and establishment of the placenta. K5 antisera or (ant)agonists can be used similarly, optionally coupled to cytotoxic agents. Antagonists may be used to induce angiogenesis, e.g. for wound healing. The K5 peptides are also used to raise specific antibodies (Ab), receptors may then be expressed in tumour cells to increase their
normal cells. Typically they have 800-times greater inhibitory activity
               response to the peptides or used for identification of smaller antagonists. The Ab are used to detect/quantify the peptides in biological samples. The K5 peptides (and K5 fusion proteins) selectively inhibit proliferation of endothelial cells with low toxicity against
                                                                                                                                                                                                                                                                                                                          This sequence is a kringle 5 (K5) peptide homologous to human plasminogen. K5 peptide fragments homologous to this sequence,
                                                                                                                                                                                                                                                                                                                                                                                   Claim 62; Page 67; 78pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                   New kringle 5 peptide(s) and fusion proteins derived from plasminogen - useful as anti-angiogenesis agents for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Davidson DJ, Gubbins EJ,

                      endothelial cell proliferation and migration. The peptides are useful for treating angiogenic diseases, primary and metastatic solid tumours and carcinomas of various organs such as breast, genital tract, endocrine glands, skin, tumours of the brain and eyes and solid tumours arising from haematopoietic malignancies such as leukaemias and lymphomas. They are also used for the prophylaxis of various autoimmune diseases (e.g., rheumatoid arthritis), ocular diseases, skin diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              which have angiogenesis as a pathologic consequence (e.g., cat scrat disease and ulcers). The peptides are also useful as a birth control agent which inhibits ovulation and establishment of the placenta. Sequences AABO1188, AABO1889 and AABO1895-BO1905 represent human plasminogen kringle 5-derived peptides synthesised and used in exemplifications of the invention.

The invention relates to a method of preparing plasminogen kringle 5 peptide fragments. The method comprises mixing mammalian plasminogen an elastase in the ratio 1:100-1:300, followed by incubating and isolating the fragment. The kringle 5 peptides are inhibitors of angiogenesis and endothelial cell proliferation and migration. The peptides are useful

Example 11; Column 38; 48pp; English

incubation and isolation

and carcinomas

for treating angiogenic diseases,

of various organs such as breast, genital tract

primary and metastatic solid

tumours

The peptides are also useful as a birth control agent which inhibits ovulation and establishment of the placenta. Sequences AAB01889, AAB01889 and AAB01895-B01905 represent human plasminogen kringle 5-derived peptides synthesised and used in exemplifications of the invention.
                                                                                                                                                                                      Preparation of Kringle five peptide fragment for treating various disorders such as angiogenic, ocular, skin diseases and cancer, involves mixing mammalian plasminogen and elastase followed by incubation and isolation -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Plasminogen; human; kringle 5 domain; endothelial cell proliferation; angiogenesis; antiproliferative; antiarteriosclerotic; cytostatic; antipsoriatic; antiinflammatory; antiulcer; antirheumatic; antiarthritic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                arising from haematopoietic malignancies such as leukaemias and lymphomas. They are also used for the prophylaxis of various autoimmune diseases (e.g., rheumatoid arthritis), ocular diseases, skin diseases

```

The invention relates to a method of preparing plasminogen kringle 5 peptide fragments. The method comprises mixing mammalian plasminogen and elastase in the ratio 1:100-1:300, followed by incubating and isolating

bonds with amino/hydroxyl/thiol

groups on blood components to

covalently

Example 6; Column 36; 48pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (e.g., psoriasis), blood vessel diseases (e.g. haemangiomas, Osler-Webber Syndrome), diseases caused by excessive or abnormal stimulation of endothelial cells (e.g., Crohn's disease, atherosclerosis), diseases which have angiogenesis as a pathologic consequence (e.g., cat scratch disease and ulcers). The peptides are also useful as a birth control agent which inhibits ovulation and establishment of the placenta. Sequences AAB01888, AAB01889 and AAB01895-B01905 represent human plasminogen kringle 5-derived peptides synthesised and used in exemplifications of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  endocrine glands, skin, tumours of the brain and eyes and solid tumours arising from haematopoietic malignancies such as leukaemias and lymphomas. They are also used for the prophylaxis of various autoimmune diseases (e.g., rheumatoid arthritis), ocular diseases, skin diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the fragment. The kringle 5 peptides are inhibitors of angiogenesis and endothelial cell proliferation and migration. The peptides are useful for treating angiogenic diseases, primary and metastatic solid tumours and carcinomas of various organs such as breast, genital tract,
             The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleinido groups) attached a less therapeutically active amino acid region (IV), which covalently
                                                                                                                                               Modifying and attaching therapeutic peptides peptidase degradation, useful for increasing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  hydroxyl; thiol;

   The present invention describes a modified anti-angiogenic peptide (I) comprising a reactive group that reacts with amino groups, hydroxyl groups or thiol groups on blood components to form stable covalent bonds. The reactive group is selected from succinimidyl or maleimido groups. (I) can have anti-inflammatory, vasotropic, cytostatic, antinheumatic, antipsoriatic, antidiabetic, antiarteriosclerotic and osteopathic activities, and is an angiogenesis inhibitor. (I) are useful
                                                                                                                                                          Claim 6; Page 9; 82pp; English.
                                                                                                                                                                                       New modified anti-angiogenic kringle 5 peptides capable of forming conjugates with blood proteins, useful for treating angiogenesis, inappropriate invasion of vessels or cancers in humans or mammals
                                                                                                                                                                                                                                                                         WPI; 2001-090970/10.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes. AAB90829 to AAB92441 represent peptides which can be used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                 (CONJ-) CONJUCHEM INC

                                                                                                                                                                                                                                                                                   metastases, angiofibromas, retrolental fibroplasia, haemangiomas, Kasposi's sarcoma or other cancers requiring neovascularisation to support tumour growth). The peptides are useful for treating these diseases in mammalian or human patients. AAB36562 represents a mammalian kringle 5 protein, and AAB36563 to AAB36577 represent specifically claimed kringle 5 peptides from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            with blood proteins. (I) are also useful for manufacturing a medicament extending the in vivo half-life of a kringle 5 peptide in a patient to provide an anti-anglogenic effect. In particular, a modified kringle 5 peptide can be used for treating inflammatory disorders (e.g. immune and non-immune inflammation, chronic articular rheumatism or psoriasis),
                                                                                                                                                                                                                                                                                                                                                                                                                             disorders associated with inappropriate or inopportune invasion of vessels (e.g. diabetic retinopathy, neovascular glaucoma, restenosis, capillary proliferation in atherosclerotic plaques or osteoporosis),
                                                                                                                                                                                                                                                  Sequence

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
